## Workflow Example to add Current Date Column

KNIME Analytics Platform

Momdog598a

1d

I would like to read in some fields from a Database Table and then add a column with the Current Execution Date. How can you combine these in a workflow so that I Write to a new database table with these combined into the 1 table?

1d

You could create the current date and time and store that in a constant value column. There are further possibilities to use these functions. You have to make sure the Create Date&Time Range node is reset every time you need it (you could connect it with flow variables eg.).
