

Using **KNIME** to Produce **Total Market Data** for Client and Datacenter

Laura Rutledge, Market Insights Manager

A bit about us...

AMD Market & Account Intelligence

The Market and Account Intelligence team compiles third-party market data to aid in the planning and execution of AMD's businesses.

The market data, as well as the resulting market forecasts produced by the team, provides information at a very granular level – by account, by region, by application, and more. This data is available for use by everyone at AMD.

AMD has adopted KNIME as its de-facto processing tool for TAMs since 2015.

This presentation touches on two of the detailed market datasets produced in KNIME.

What is **Total Market Data?**

Total Available Market or
Total Addressable Market

TAM 🥧 **THE WHOLE PIE**

Bigger TAM => Bigger PIE

Smaller TAM => Smaller PIE

Bigger piece of the pie means a larger share of the TAM.

TAM is...

...stored historically and forecasted into the next 3-5 years

...sliced/layered by multiple different categories, geographies, accounts, applications, depending on the focus of the business.

...very critical to get right - BUSINESS PLANS, TARGETS and GTM strategies depend on the correct interpretation of TAM

② Build Data Set

Raw Data (Multiple data sources)

Each dataset is multi-dimensional (n) and has different attributes/feature-sets and are to be included together.

② Build Data Set

In some cases, base data is also incoherent/insufficient to capture actual TAM and hence needs to be “sanitized” with the help of additional data sources.

② Build Data Set

The datasets from various sources are then combined to form a “MASTER” internal data set which is then used as the “base” of the TAM process.

② Build Data Set
